SOME EPIC PROPOSAL TITLE

Say you're about to write some epic observing proposal. Or anything else where you have a strict page limit, which is why you use two-column format by default.

Say you want the reader to see that you have done awesome stuff, so you cite everything with author names (Poppenhaeger et al., 2013).

This will use quite some space in the proposal text, which means you want to save space in the references section. So I've made a bibliography style file (.bst) and a python script to hack the output from that file in order to get a really small references section.

So, let's cite some more stuff and see what it looks like: Günther et al. (2012); Robrade et al. (2012); Albrecht et al. (2012).

We run `pdflatex` (or `latex`):

`pdflatex example`

then `bibtex`:

`bibtex example`

and then we run the python script:

`python bib_tiny.py example.bbl`

Then we re-run `pdflatex`/`latex` twice to get the references correct:

```
pdflatex example
pdflatex example
```

And then the tiny references section looks like this:

Albrecht, S., et al. 2012, ApJ, 757, 18 • Günther, H. M., et al. 2012, AJ, 144, 101 • Poppenhaeger, K., et al. 2013, ApJ, 773, 62 • Robrade, J., et al. 2012, A&A, 543, A84 •
